

How do I list the contents of an archive?

First, if the archive isn't already open and started up

```
RSS$source <-  
SEASCANARCH$get.ports()[[1]]          ## make  
the source a seascan archive reader  
  
config(RSS$source, filename="c:/data/  
myseascanarch.dat") ## set the filename  
start.up(RSS$source)
```

Then, get the contents:

```
get.contents(RSS$source) ## a list with start/end  
times and numbers of scans for each segment
```
